

SurgiTouch™

SURGICAL LASER AUTOMATION SYSTEM

SurgiTouch is a User Interface and represents an application guided surgery automation system. The innovative user interface allows the physician to select specific applications among common medical specialties and SurgiTouch automatically recommends an appropriate to be used laser accessory and pre-selects laser treatment parameters. The user can focus on the surgery-not the set-up. SurgiTouch then communicates with a scanning device that automatically performs the specific treatment with unprecedented precision, safety and convenience.
